

Sustainability

Recycling Made Simple: Introducing Our Geomembrane Take Back Program

As part of our commitment to sustainability, Plastatech is proud to offer a new way to recycle your used or scrap PVC membranes. Our Geomembrane Take Back Program ensures your excess material won't end up in a landfill – instead, it will be responsibly recycled and repurposed, reducing waste and promoting a circular economy.

Let us handle the hard part while we build a greener future together.

A Sustainable Vision

Sustainability is more than a concept at Plastatech®, it's our culture. Our founder, John R Burt, believed in recycling manufacturing scrap into new products as a way to reduce environmental impact and improve fiscal responsibility. Today, that same vision drives not only the sustainability of our products, but of our manufacturing processes as well.

Our Recycling Efforts

Plastatech recycles 90% of its waste; including non-manufacturing byproducts like plastic, paper, cardboard and super sacks; we do this by:

- Partnering with local recycling companies
- Regrinding PVC scrap back into the manufacturing process
- Repurposing additional scrap to Oscoda Plastics® for use in its resilient commercial flooring products, concrete expansion joints and roofing accessories

Sustainable Operations

Because Plastatech geomembranes are manufactured from our own proprietary calendered PVC films and weft-inserted textiles, we have complete control over each component, overall product quality and the manufacturing process. This control allows us to ensure our sustainability priority is incorporated at every step.
